

QUARTERLY ACTIVITIES REPORT

For the quarter ended 31 December 2018

Metals Australia Ltd (ASX: MLS) is pleased to report its activities for the quarter ended 31 December 2018.

OVERVIEW

During the Quarter, Metals Australia completed its Phase I exploration program at the Lac Rainy Graphite Project, located in Quebec, Canada. The program consisted of surface stripping, mechanical excavation and channel sampling across the width of the graphite mineralised zones. The results exceeded the expectations of the Board and provided the Company with the confidence to continue with its planned exploration campaigns, which include a maiden diamond drilling program to commence during 2019, as part of the Phase II exploration program.

In addition, during the Quarter, the Company continued with its evaluation of the Manindi Lithium Project and continued to hold discussions with potential joint development partners in relation to the next stage of exploration to take place at the Manindi Lithium Project.

During the upcoming Quarter, the Company plans on advancing its exploration plans at the Lac Rainy Graphite Project, including maiden diamond drilling, metallurgical testing, and further engagement with end-users and joint development partners across North America and Europe.

GRAPHITE, COBALT AND LITHIUM PROJECTS IN QUEBEC, CANADA

Metals Australia, through its wholly owned subsidiary Quebec Lithium Limited (QLL) owns a 100% interest in the following exploration projects, located in Quebec, Canada (Figure 1):

- Lac Rainy Graphite Project
- Lac du Marcheur Cobalt Project
- Lac La Motte Lithium Project
- Lac La Corne Lithium Project
- Lacourciere-Darveau Lithium Project

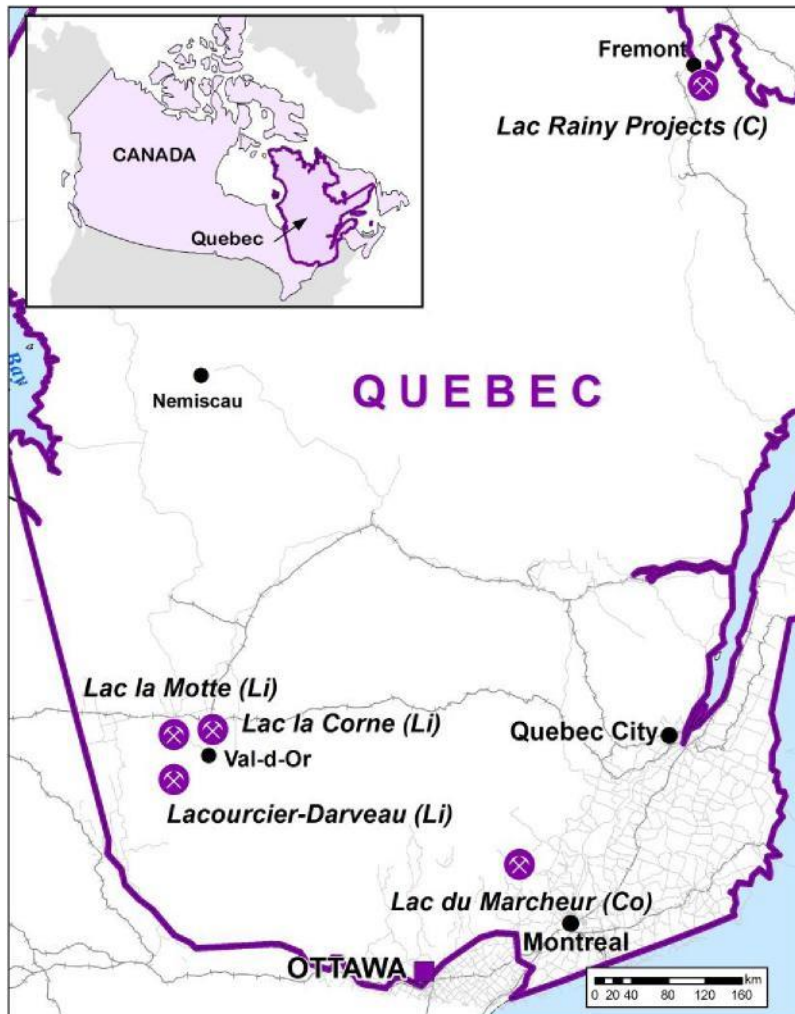

During the Quarter, Metals Australia received all of the results for the Phase I channel sampling program at Lac Rainy, with the results exceeding the expectations of the Board, both in grade and continuity of the mineralisation.

Metals Australia has received all the permits required to progress exploration programs at Lac Rainy, including the planned drilling program to commence during 2019.

The planned drilling program comprises of diamond drilling to test the grade and down-dip continuity of the mineralisation in priority areas identified by the channel sampling.

Magnor Exploration Inc. (Magnor) has been appointed to oversee the Phase II exploration campaigns and will provide all levels of geological and technical assistance in the field over the duration of the programs.

Figure 1: Location map of projects in Quebec, Canada

LAC RAINY GRAPHITE PROJECT

The Lac Rainy project consists of a contiguous landholding of 88 mineral claims covering an area of approximately 45.5 km² located 22 km south-west of the historic mining town of Fermont in one of the premier graphite mining regions of Quebec. The Lac Rainy Project is approximately 15 km east of Route 389, a paved highway that links the Project with major ports along the St. Lawrence River.

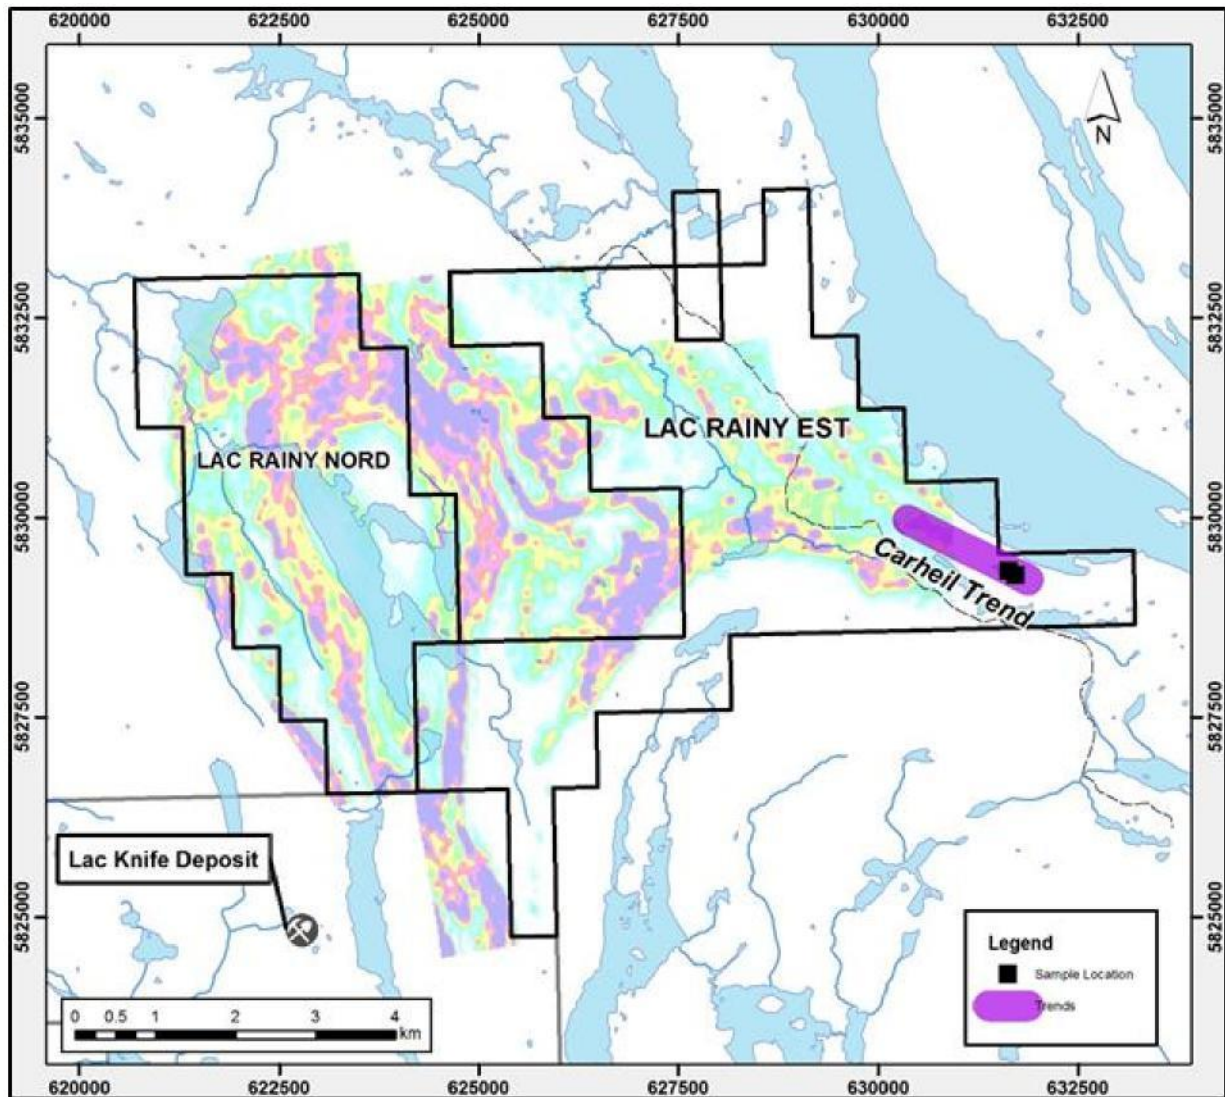

GEOLOGY AND MINERALISATION

Within the Lac Rainy Graphite Project, the graphite is hosted in biotite-quartz-feldspar paragneiss and schist of the Nault Formation. High-grade metamorphism and folding has resulted in the formation of important concentrations of graphite dominated by value-enhanced large flakes.

The Project is located adjacent to the Lac Knife Property, which hosts the Lac Knife Graphite Deposit owned by Focus Graphite Inc. (less than 4 km south-west of the Project) that has a Measured and Indicated Resource of 13.6 Mt @ 14.95% Cg and an Inferred Resource of 0.8 Mt @ 13.90% Cg at a 3.0% Cg cut-off (*refer Focus Graphite TSX-V market announcement dated 6 March 2017*).

The high-grade Lac Carheil Prospect is located less than 200 m from the southeast licence boundaries of the Project area. High-grade graphite samples at Lac Carheil include 35.49% Cg and 40.67% Cg. The close proximity of numerous high-grade graphitic carbon results at nearby occurrences highlights the strong potential for further graphite mineralisation to be identified at the Lac Rainy Graphite Project (Figure 2).

Figure 2: Claim boundaries for the Lac Rainy Nord and Lac Rainy Est Graphite Project overlaid with the results of the recent airborne geophysical program

EXPLORATION PROGRAM DURING QUARTER

During the previous Quarter (period ended 30 September 2018), the Company completed the Phase I exploration campaign at the 100%-owned Lac Rainy Graphite Project, located in Quebec, Canada.

Magnor Exploration successfully completed 16 exploration lines (mechanically excavated trenches) representing a total of 677 lineal metres of trenching as part of the Phase I channel sampling campaign (Figure 3). A total of 453 lineal metres of channel sampling were completed which generated 459 samples including blank, standard and duplicate samples.

A further 89 samples were collected from the project-wide prospecting and mapping campaign which was designed to follow up on the airborne geophysical targets identified by the Company during its EM program in mid-2017.

Figure 3: Trenching and sampling being undertaken at the Lac Rainy Graphite Project, Quebec

Discussion of Channel Sampling Results

The assay results for the exploration lines completed at Lac Rainy, which were received during November and December 2018 were compiled, analysed and included in the geological model built by the Company. All but three (3) trenches intersecting high-grade graphite across extensive and continuous zones.

The assay results for the first six exploration lines included (refer to ASX announcement dated 21 November 2018):

- **20.4m at an average grade of 15.6% Cg within Trench 1A Incl. 4.5m at an average grade of 20.0% Cg**
- **22.0m at an average grade of 13.51% Cg within Trench 2 Incl. 8.0m at an average grade of 21.42% Cg**
- **8.0m at an average grade of 9.55% Cg within Trench 4 Incl. 3.0m at an average grade of 15.58% Cg**
- **19.5m at an average grade of 9.07% Cg within Trench 5 Incl. 8.0m at an average grade of 5.76% Cg**
- **16.0m at an average grade of 19.8% Cg within Trench 11 Incl. 10.9m at an average grade of 23.08% Cg**
- **14.5m at an average grade of 18.53% Cg within Trench 13**
- **16.0m at an average grade of 12.29% Cg within Trench 13**
- **5.0m at an average grade of 14.10% Cg within Trench 13**

The best results received from the second batch of channel samples included (*refer to ASX announcement dated 17 December 2018*):

- **9.1m at an average grade of 6.57% Cg within Trench 1**
- **26.6m at average grade of 9.23% Cg of Trenches 3, 3A and 3B from continuous and lateral correlation samples (remains open)**
 - Incl. 5.0m at an average grade of 12.41% Cg (remains open)**
- **12.0m at an average grade of 10.95% Cg within Trench 6**
 - 6 Incl. 7.0m at an average grade of 13.57% Cg**
- **8.7m at an average grade of 27.28% Cg within Trench 10 (remains open)**
- **6.0m at an average grade of 12.35% Cg within Trench 11A**
- **29.3m at an average grade of 15.66% Cg within Trench 12 (remains open) Incl. 16.3m at an average grade of 20.35% Cg**

The assay results from the channel sampling program highlighted the extensive width and continuity of the high-grade graphite mineralisation at Lac Rainy. Importantly, the mineralisation at Lac Rainy appears to be consistent in terms of the Cg grade exhibited.

In addition, trenching has successfully identified a Southeast and Northwest extension of the known high-grade Carheil Zone. **Adding the new Northwest and Southeast extensions, including historic high-grade Cg occurrences, the Carheil Zone has a potential economic envelope of 3.2 km in length by 10 m to 45 m in width.**

Of significant interest is the new **high-grade “Carheil East Zone”** that was identified during the field prospecting program which measures in excess of 450m in length.

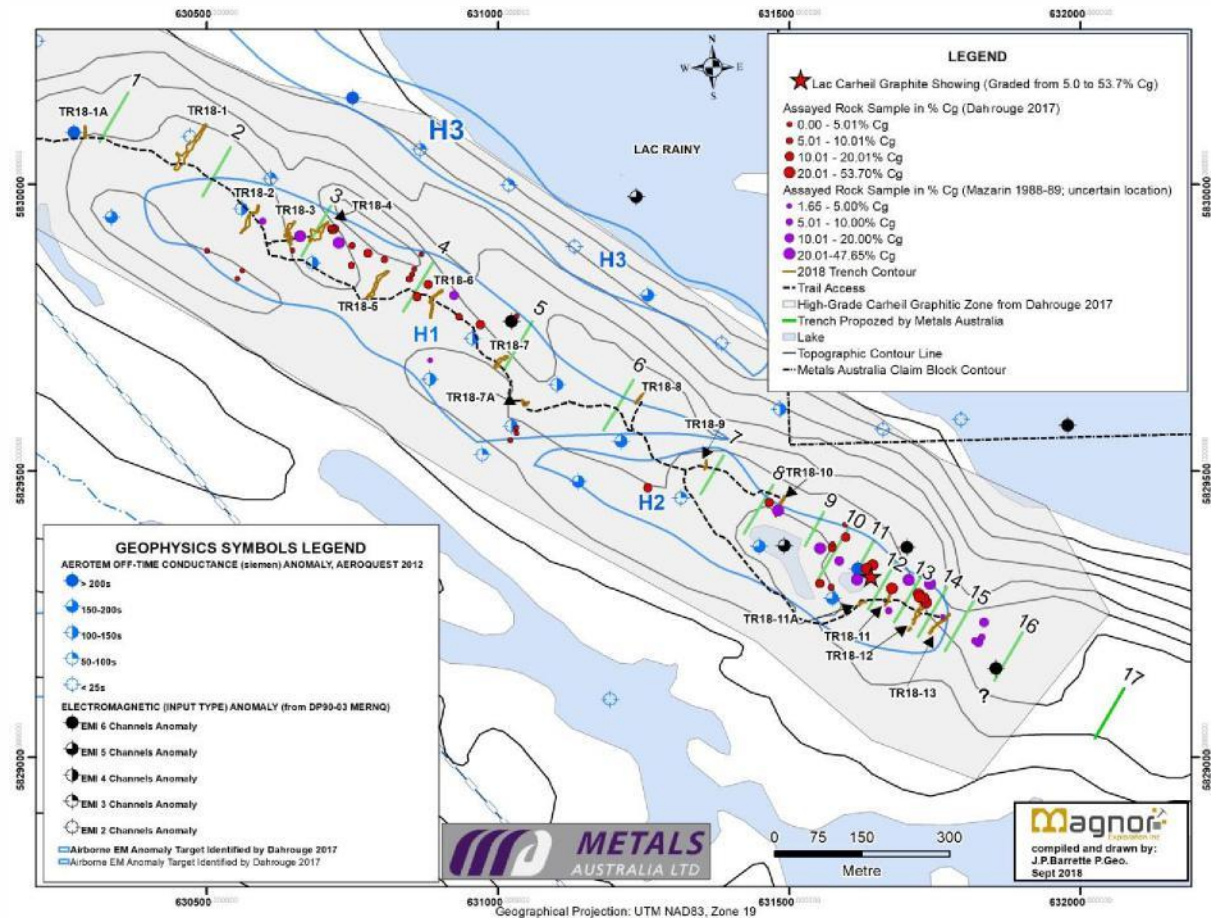

High-grade results received from the rock sampling program include: (*refer to ASX announcement dated 17 December 2018*)

- **43.6% Cg (composite from an outcrop measuring 2m x 0.5m)**
- **43.0% Cg (composite from historic channel sampling locations)**
- **31.3% Cg (outcrop grab sample)**
- **31.0% Cg (outcrop grab sample)**
- **30.8% Cg (outcrop grab sample)**
- **28.2% Cg (outcrop grab sample)**
- **27.5% Cg (outcrop grab sample)**
- **26.6% Cg (outcrop grab sample)**
- **26.1% Cg (outcrop grab sample)**

These high-grade zones will be followed up through subsequent field exploration programs to take place during 2019 and will initially comprise of trenching and channel sampling. As these additional zones of graphite-rich mineralisation are outside of the area of interest for the maiden drilling program, these discoveries represent additional zones of mineralisation, which were previously unknown, highlighting the potential scale of the graphite in place at Lac Rainy.

The identification of the Carheil East Zone potentially represents a second major parallel structure that is host to high-grade graphite (Figure 4). This is a significant finding as that area was previously obscured by shallow cover. Discoveries such as this demonstrate that Metals Australia has only just started to “scratch the surface” in terms of realizing the true potential of the Lac Rainy project.

Figure 4: Channel Samples at Lac Rainy Project area exhibiting the strike length of the mineralised zone identified to date measuring in excess of 1.8 km, and up to ~3.2 km when coupled with historic sampling

As part of the expanded Phase I program completed during the previous Quarter, the Company also completed a field reconnaissance and mapping program aimed at generating additional graphite-rich mineralized horizons that could be followed up with future trenching and channel sampling.

During the construction phase of the project-wide access tracks, a number of graphite-rich outcrops and boulders were identified. This is typical for the Lac Rainy area where very shallow cover can at times obscure the graphite mineralisation at surface. Discoveries such as these highlight the significant exploration upside that exists within the project, beyond the already known high-grade zones of mineralisation, such as at Lac Carheil.

The field reconnaissance program was successful in identifying additional zones of graphite mineralisation with **more than eighty-nine (89) significant graphite mineralised sites identified on the project in outcrops and from graphite-rich boulders.**

Further End User / Project Development Partner Engagement

In addition to the maiden diamond drill program, **advanced metallurgical testwork will be undertaken on split drill-core samples.** Following completion of the planned drilling program and advanced metallurgical testwork, Metals Australia will focus on engaging with North American end-user / project development partners for its high-grade graphite concentrate. To achieve this objective, the Company plans on appointing an external marketing / business development specialist with specific networks into the graphite and graphene industry of North America. **North American groups can offer a simpler logistics pathway for Lac Rainy graphite concentrate.**

In addition to further metallurgical testwork being completed, the Company also plans on undertaking an initial round of graphene testwork which will be based on extracting / producing graphene from the Lac Rainy graphite concentrate.

Graphite has been classified by the U.S. as a strategic and critical mineral resource with growing markets in the lithium-ion battery and other sectors. The U.S. imports all of its natural graphite with average annual imports of more than 50,000 tons for the past 6 years. There has been no flake graphite production in the U.S. since 1980. This represents an interesting marketing opportunity for Metals Australia in positioning the Lac Rainy graphite concentrate as a high-value / high-specification product.

The Company continues to engage with Nanhai Carbon and believes that this relationship will become stronger in 2019 once a resource has been delineated at Lac Rainy and following receipt of more representative metallurgical testwork. A preliminary testing report was not received from Nanhai Carbon based on the samples previously provided, however based on the exchange of email dialogue and direct communication with the Company’s Chinese agent, Nanhai Carbon was satisfied with the performance of the Lac Rainy graphite concentrate but required a larger sample size to be more confident in the consistency of the product. This will be addressed following completion of the maiden drilling program.

Work Planned for the Upcoming Quarter

During the next Quarter, the Company plans on commencing its maiden diamond drilling program. The initial drilling program will focus on the high-grade Lac Carheil Prospect with the aim of identifying sufficient down-dip extensions of mineralisation to achieve the delineation of a maiden graphite resource. The initial diamond drilling program will comprise of approximately 1,500 m across 10-15 individual drill holes.

An extended permit for drilling has recently been received from the MERN. The drilling permit will allow the Company to drill during the current Quebec-winter season and also expand its drilling program without having to seek additional approvals.

BASE METAL PROJECTS, WESTERN AUSTRALIA

Metals Australia Ltd (MLS or the Company) holds an interest in two base metal projects in Western Australia (Figure 5).

The Manindi Project is located around 500 km northeast of Perth, and is being explored by MLS with a view to expanding the existing zinc-copper resources and examining the project’s potential for lithium mineralisation.

The Company also has an interest in the Sherlock Bay Nickel-Copper-Cobalt Project located in the western Pilbara region that is operated by Sabre Resources Ltd (ASX:SBR).

MANINDI PROJECT

The Manindi Project is a significant unmined zinc deposit located in the Murchison District of Western Australia, 20 km southwest of the Youanmi gold mine. The project is located on three granted mining leases.

The Manindi base metal deposit is considered to be a volcanogenic massive sulphide (VMS) zinc deposit, comprising a series of lenses of zinc-dominated mineralisation that have been folded, sheared, faulted, and intruded by later dolerite and

Figure 5 – Location of the Western Australian base metals projects.

gabbro. The style of mineralisation is similar to other base metal sulphide deposits in the Yilgarn Craton, particularly Golden Grove at Yalgoo to the west of Manindi, and Teutonic Bore-Jaguar in the Eastern Goldfields.

EXPLORATION WORK COMPLETED DURING QUARTER

Manindi Lithium Project

Lithium-bearing pegmatite dykes have previously been identified on the Manindi mining leases in the vicinity of the Mulgara-Warabi Prospect areas (*refer to ASX announcement dated 21 March 2017*). Surface mapping identified at least three lepidolite mineralised pegmatite dykes outcropping at surface with strike lengths of over 300 m and widths up to 25-30 m.

During the previous Quarter (period ended 30 September 2018), the Company completed an RC drilling program to test three outcropping pegmatite dykes that contain lepidolite mineralisation. A total of 17 RC holes were completed, for a total of 837 metres of drilling (*refer to ASX announcement dated 21 June 2018*).

The assay results from the drilling program demonstrated that the pegmatite dykes are fertile and mineralised with lithium and tantalum throughout the interval that they were intersected in drilling. Significant intersections of lithium mineralisation typically occur in continuous zones within the pegmatite dykes, which were up to 15 m true thickness. Continuity of the dykes was established over strike lengths of up to 200 m.

Highest grade lithium mineralisation was intersected in hole MNRC030 and MNRC033, where maximum 1 m results of 1.96% Li₂O (20-21 m) and 1.90% Li₂O (33-34 m) were returned, respectively. Hole MNRC032 contained only anomalous lithium but significant tantalum (10-17 m, 7 m @ 599 ppm Ta₂O₅) suggesting that there is some zonation of the lithium and tantalum mineralisation.

These encouraging initial results suggest that a further exploration program of field mapping and sampling should be conducted prior to an expanded drilling program and further metallurgical testwork.

Further Work

MLS is currently evaluating the potential to execute a follow-up drilling campaign designed to extend and infill the drilling of the lithium mineralised pegmatites, which are still open down-dip and along strike. Furthermore, there are other pegmatite occurrences within the project area that will also be evaluated for lithium mineralisation.

In addition, the tantalum mineralisation is an important element of the mineralised pegmatites at Manindi and warrants further investigation. Future exploration will be designed to better define the tantalum mineralisation and the zonation of the pegmatites.

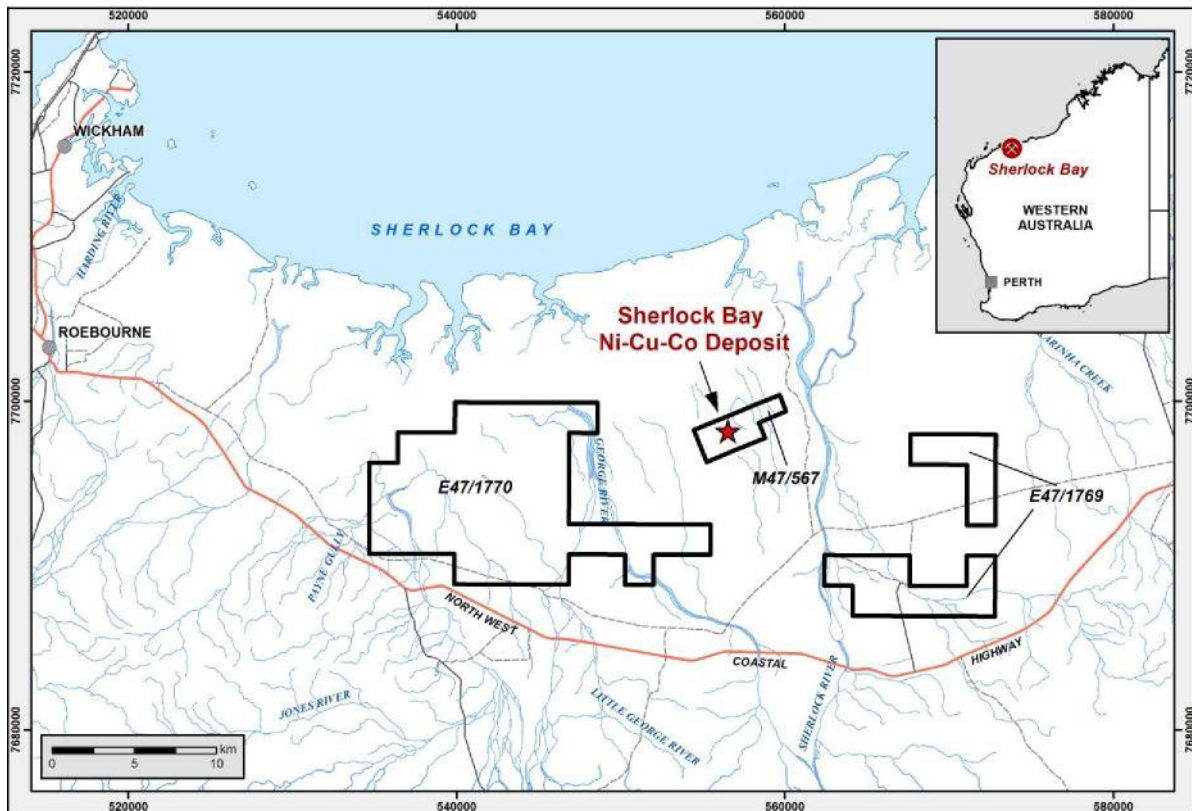

Concurrent with the ongoing geological evaluation and exploration of the project, the Company is currently in discussions with third parties regarding a potential farm-in and/or acquisition of the Manindi Lithium Project.

SHERLOCK BAY PROJECT

The Sherlock Bay Project comprises a mining lease (M45/567) and two exploration licences (E47/1769 and E47/1770) located in the western Pilbara (Figure 6). The mining lease contains the Sherlock Bay nickel-copper-cobalt deposit. MLS hold a 4.5% interest in the project through a restructure of the ownership (*refer to MLS announcement dated 29 January 2018*).

The Project is managed by Sabre Resources Ltd (ASX: SBR) who hold a 70% interest. The MLS interest in the project is 'free-carried' through to the completion of a bankable feasibility study and the decision to commence commercial mining.

Figure 6: Location of the Sherlock Bay Ni-Cu-Co deposit.

Sabre Resources has received the results of a review and update of the mining study conducted on the Sherlock Bay nickel-copper-cobalt deposit by AMC Consultants Pty Ltd (*refer to Sabre Resources ASX announcement 14th August 2018*). The results of the mining study were positive and have encouraged the Company to proceed with further studies of processing options and to update estimates for the capital and operating costs for the Sherlock Bay Project.

In June 2018, Sabre commissioned AMC Consultants Pty Ltd (AMC) to undertake a review of the previous mining study for the Sherlock Bay deposit to update costs for the open pit mining and evaluate the underground mining.

The open pit cost update was based on the recently updated resource estimate, which is restated in compliance with the JORC Code 2012 (*refer to Sabre Resources ASX announcement 12th June 2018*). The underground cost update has been based on the resource model and evaluation detailed in the Sherlock Bay Mining Study report completed by AMC in 2005 (2005 Report).

To comply with ASX Listing Rules, Sabre cannot release details of projected cash flows and detailed costs in the mining study update at this time. These data will be released on completion of a processing study and when fully incorporated into a comprehensive scoping/pre-feasibility study.

The open pit optimisation, pit design and all cost updates (both open pit and underground) were carried out by AMC at scoping study level. The updates are based on contractor mining. The scoping studies referred to in this report are based on low-level technical and economic assessments and are insufficient to support estimation of Ore Reserves or to provide assurance of an economic development case at this stage, or to provide certainty that the conclusions of the scoping studies will be realised.

The updated resource estimate block model, relevant input parameters and mining costs were used by AMC to create optimal pit shells using Whittle Four-X software. A suitable pit shell was used to prepare a preliminary pit designs, pit stages and schedule.

The updated costs for the underground were applied to the evaluation detailed in the 2005 Report for mining using a longitudinal sublevel caving method. There were no changes to:

- Resource model used;
- Mining method;
- Access and infrastructure;
- Ventilation;
- Materials handling;
- Mining designs; and
- Schedules (capital development, operating development, production).

Sabre Resources is continuing to review and update the substantial feasibility study work that has previously been completed on the development of the Sherlock Bay deposit. The extensive information already available will allow the Company to rapidly advance the evaluation of the project to feasibility stage.

Competent Person Declaration

The information in this report that relates to Exploration Targets, Exploration Results, Mineral Resources or Ore Reserves is based on information compiled by Mr. Martin Bennett, a consultant to Metals Australia Ltd, and a member of The Australasian Institute of Mining and Metallurgy. Mr. Bennett has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resource and Ore Reserves". Mr. Bennett consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

Forward-Looking Statements

This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning Metals Australia Ltd's planned exploration program and other statements that are not historical facts. When used in this document, the words such as "could," "plan," "estimate," "expect," "intend," "may", "potential," "should," and similar expressions are forward-looking statements. Although Metals Australia Ltd believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties and no assurance can be given that actual results will be consistent with these forward-looking statements.
